

AI Notes Ticket Triage System

Operational Specifications, System Architecture & SLA Runbook

1. Document Control

- * **Document ID:** SOP-AITTS-2026-V1
- * **Classification:** Restricted - Operation Core
- * **Owner:** Chief AI Systems Administrator
- * **Last Modified:** Tuesday, June 9, 2026

2. System Overview

The **AI Notes Ticket Triage System** is a real-time, zero-trust telemetry ingestion and anomaly classification middleware pipeline. It monitors continuous streams of server performance metrics, computes mathematical deviation metrics on a sliding window frame, and utilizes Gemini Neural Copilots to triage and compile context-rich remediation protocols ("Tickets").

This system prevents service disruption by classifying minor drifts before they become site outages.

3. Core Architecture & Pipeline Ingestion

...

```
[ Telemetry Stream ] -> [ Ingestion Controller ] -> [ Rolling Z-Score Engine ]
| (If Z-Score > Threshold)
v
[ Real-Time UI Dashboard ] <- [ Security Audit Logs ] <- [ Anomaly Ticket Dispatch ]
||
v v
[ operator@anomaly.io ] <----- [ Manual Triage ] <--- [ Gemini AI Analysis Room ]
```

...

- * **Ingestion Layer:** Standardized TCP/HTTP channels pushing real-time microsecond server-state markers.
- * **Heuristic Triageing:** Calculates dynamic Moving Average (μ) and Moving Standard Deviation (σ). Flagged automatically when the current event value violates standard deviation boundaries.
- * **LLM Engine:** Multi-turn Gemini 3.5 Flash server proxy. Triggered for dynamic root-cause compilation, correlation analysis across disparate streams, and mitigation SOP generation.

4. Privilege Matrix & Enforcement

Role-based authentication restricts endpoint changes and diagnostic overrides:

Role	Dashboard Visibility	Stream Control & Injections	Security Configurations	Admin Purges
:---	:---	:---	:---	:---
Viewer	Enabled (Read-only)	Locked	Locked	Locked
Operator	Enabled (Full access)	Enabled (Dynamic state modification)	Locked	Locked
Admin	Enabled (Full access)	Enabled (Full access)	Enabled (Override settings)	Enabled (Full purge permissions)

5. Standard Operating Procedures (SOP)

In the event of a **Critical Severity Anomaly**:

1. **Lock Outflow:** Transition stream settings to dynamic pause state if cascading database errors are present.
2. **Consult Gemini:** Execute `COMPILE SYSTEM AI REPORT` inside the **AI Analytics** hub.
3. **Quarantine Tenant:** Revoke suspicious operator credentials in the **Identity Access** panel.
4. **Post Audit:** Purge historical metrics caches *only* after securing logs offsite.
